EAGLE UHMW PE 1000 GRADE PLATING BARRELS

The construction of Eagle plating barrels is of a unique design, using highest quality materials to provide excellent performance.

In our customers' opinion, the competitive purchase cost of Eagle electro-plating barrels, combined with the greatly extended life ratio over inferior materials and construction methods, make our barrels the most cost effective available.

U.H.M.W PE 1000 Grade Polyethylene has at least 5 times the wear ability of Polypropylene (official technical charts and material data available on request) and allows for maximum perforated open area for increased solution and electrolytic transfer.

The above volumetric chart demonstrates wear characteristics of various materials. As can be seen here, UHMW PE 1000 grade has an abrasive resilience far superior to that of steel and above 6 times that of Polypropylene (PP). That's why we use it to make our plating barrels.
